

Certification of Service Line Material Classification

To: Lead and Copper Program Manager
Arkansas Department of Health
Engineering Section
4815 W. Markham Street, Slot 37
Little Rock, Arkansas 72205-3867

PWS: 837

System Name: Brunner Hill Water Assn

For the purpose of this service line inventory, the following definitions apply:

Service line - a portion of pipe which connects the water main to the building inlet. Where a building is not present, the service line connects the water main to the outlet.

Lead service line - a service line, either utility-owned or customer-owned, that is made of lead or where a portion of the service line is made of lead.

Galvanized service line - iron or steel piping that has been dipped in zinc to prevent corrosion and rusting.

Galvanized requiring replacement - a galvanized service line, either utility-owned or customer-owned, that currently is or ever was downstream of a lead service line.

Lead status unknown - A service line, either utility-owned or customer-owned, where the material is not known to be lead, galvanized requiring replacement, or a non-lead service line, such as where there is no documented evidence supporting material classification.

Connector - also referred to as a gooseneck or pigtail, means a short segment of piping not exceeding two feet that can be bent and is used for connections between rigid service piping, typically connecting the service line to the main.

I certify all service lines and connectors for Brunner Hill Water Assn were installed after the June 1, 1988 lead ban. The water system has no lead service lines, no galvanized service lines requiring replacement, no service lines of unknown lead status, no lead connectors, and no connectors of unknown lead status, each as defined above.
